Many people think of attention as a light that can simply be aimed at whatever task is important. Yet attention is more like a budget that must be spent. When a student keeps a phone on the desk while reading, no message needs to arrive for the phone to matter. Part of the mind is already assigned to the possibility of interruption. In the same way, an open browser tab or a half-finished conversation can silently occupy mental space. The result is not always an obvious failure to understand; more often, it is a shallow version of understanding that feels complete. Protecting attention, therefore, is less about having strong willpower at a dramatic moment and more about designing an environment where fewer things compete for the mind in the first place.

1. the role of digital tools in expanding social relationships
2. the importance of removing potential distractions to preserve attention
3. the way students can improve memory through repeated reading
4. the benefits of multitasking in modern learning environments
5. the need to measure academic achievement with diverse methods

In many teams, disagreement is treated as a problem to be solved quickly. Meetings are arranged to make everyone reach the same conclusion, and a smooth atmosphere is mistaken for progress. However, creative teams often benefit from a different approach. They allow early ideas to be challenged before those ideas become too expensive to change. A designer may question an engineer's assumption, or a new employee may point out that customers will not read an instruction page as carefully as experts do. Such friction can be uncomfortable, but it prevents the group from protecting a weak plan simply because it is already familiar. In this sense, productive disagreement helps a team _____.

1. avoid improving ideas after they are publicly announced
2. replace expert judgment with customer opinions entirely
3. discover weaknesses before commitment makes them harder to fix
4. maintain harmony by postponing difficult questions
5. reduce the number of people involved in decision-making

Urban planners increasingly recognize that benches, trees, and small public squares are not merely decorative. They shape how people experience a city. A street with places to pause can make walking feel less like a task and more like a social activity. Older residents may travel farther when they know there are spots to rest, and shop owners may benefit when pedestrians slow down. For these reasons, removing seating to keep sidewalks visually clean can have the ① unintended effect of making public space less welcoming. A city that values movement alone may become ② efficient on paper but ③ generous in lived experience. Good design does not simply push people through space; it ④ invites them to remain, observe, and meet others. Thus, the success of a street should be judged not only by how fast people pass through it but also by how comfortably they can ⑤ inhabit it.

When a new scientific instrument is introduced, it does not merely collect more facts. It can also change what researchers consider worth asking.

(A) Before that tool existed, questions about those tiny movements were difficult to form with precision. Scientists could suspect that change occurred, but they lacked a stable way to describe it.

(B) Consider a sensor that measures minute changes in soil moisture across a field every few seconds. Once such measurements become available, researchers begin to ask how roots respond to short bursts of rain rather than only to seasonal totals.

(C) This shift shows that instruments are not passive windows onto nature. By making certain patterns visible, they encourage some questions and make other questions seem less central.

Yet this apparent waste can serve as a form of exploration.

In nature, young animals often engage in activities that seem unrelated to immediate survival. ① A young fox may pounce on leaves, miss repeatedly, and then chase its siblings with no visible reward. ② If every action had to produce food or safety at once, such behavior would look inefficient. ③ Through play, however, the animal tests its body, practices flexible responses, and learns what other animals are likely to do. ④ The value of play is therefore not found in a single successful outcome but in the range of possibilities it opens for later situations. ⑤ What looks purposeless in the moment may become preparation for uncertainty.

Some museums are rethinking the assumption that silence is the ideal condition for appreciating art. ① In traditional galleries, quietness has often been used to create an atmosphere of seriousness, encouraging visitors to look carefully and speak softly. ② However, this atmosphere can also make some visitors feel that they are being tested on knowledge they do not have. ③ For this reason, certain museums now design guided conversations, sound-based activities, or family discussion zones that allow interpretation to become shared rather than private. ④ The chemical materials used in restoring old paintings must be selected carefully to avoid long-term damage. ⑤ These changes do not mean that every exhibition should become noisy; rather, they suggest that meaningful attention can be supported by different kinds of social interaction.
