The notion that scientific objectivity requires the complete removal of the observer is one ①that has been increasingly challenged. In many fields, the very act of measurement ②alters the phenomenon under study, a reality ③making the ideal of a detached observer untenable. Physicists studying subatomic particles discovered that whether light behaves as a wave or a particle depends on how ④it is observed. This does not mean that objectivity is worthless; rather, it demands that researchers acknowledge the conditions under ⑤where their data were gathered.

Among the many creatures that inhabit coral reefs ①is the cleaner wrasse, a small fish ②whose survival depends on a peculiar arrangement. Larger fish, which could easily consume it, instead allow the wrasse ③to enter their mouths and remove parasites. So reliable is this service ④what predators refrain from eating their tiny helpers. Scientists believe that this mutual trust, ⑤developed over millions of years, illustrates cooperation without conscious intent.

When we call a decision "rational," we usually imagine a cold calculation stripped of feeling. Neuroscience, however, tells a more complicated story.

(A) Deprived of the emotional signals that normally tagged options as good or bad, they found themselves paralyzed, endlessly weighing trivial factors without ever reaching a conclusion.

(B) Patients with damage to this region retained their logical reasoning and could list the pros and cons of any choice with striking precision. Yet their lives fell into disarray.

(C) Studies of individuals with injuries to the ventromedial prefrontal cortex—an area linking emotion and judgment—reveal a surprising truth about how choices are actually made.

① (A)-(C)-(B) ② (B)-(A)-(C) ③ (B)-(C)-(A) ④ (C)-(A)-(B) ⑤ (C)-(B)-(A)

> This apparent contradiction dissolves once we recognize that forgetting is not a failure of the system but one of its most sophisticated functions.

Memory is often praised as if its sole virtue were retention. (①) We admire those who can recall vast quantities of information and pity those who cannot. (②) But a brain that recorded everything with equal permanence would be overwhelmed, unable to distinguish the significant from the trivial. (③) By discarding what no longer serves us, the mind clears space for patterns and generalizations. (④) In this light, the person who forgets a phone number but grasps the essence of a conversation may be remembering more wisely than the one who retains every digit. (⑤)

Economists have long puzzled over why people tip in restaurants they will never visit again. From a purely self-interested standpoint, the rational act would be to enjoy the service and walk away. That so many choose otherwise suggests that human behavior is guided not merely by immediate calculation but by _____. We carry with us habits and moral sentiments forged in small communities where reputation was everything and every interaction was likely to be repeated. These internalized norms persist even in anonymous settings where their original logic no longer applies.

① a desire to maximize short-term financial gain
② dispositions inherited from a very different social world
③ the fear of legal punishment for social violations
④ carefully negotiated contracts between strangers
⑤ an instinctive suspicion of unfamiliar people

In debates about wilderness preservation, the word "natural" often functions as a rhetorical trump card. Yet the landscapes we cherish as pristine are frequently the ①product of long human management. The open meadows and controlled forests that European settlers described as untouched had in fact been ②shaped for centuries by indigenous burning practices. To treat such places as purely wild is to ③erase the people who tended them. This does not ④strengthen the case for protection; rather, it complicates our comfortable division between the human and the natural, reminding us that even our ideal of untouched nature is a ⑤cultural construction.

What makes a metaphor powerful is not merely the similarity it points to, but the fresh perspective ①it forces upon us. To describe time as a river is to invite us to feel ourselves ②carried along by a current we cannot resist. Had the ancient poets ③chosen a different image, our very sense of temporal experience might be otherwise. This is why translating poetry proves so difficult: a metaphor that resonates in one language may sound absurd in another, ④leaving the translator to search for an equivalent that ⑤evoke a comparable feeling.
