> We like to picture the rational thinker as someone who accepts nothing she has not checked for herself. Taken seriously, however, this ideal would not liberate the mind so much as paralyze it.

(A) This is not a lapse in rationality but the very condition of it. The question worth asking, therefore, is not whether to depend on others but how to tell testimony that merits such dependence from testimony that merely mimics its form.

(B) Consider how little of what even a highly educated person knows could survive such a test. She has never measured the distance to the sun, never sequenced a genome, never examined the archives on which her picture of the past is built.

(C) What she has done instead, in every one of these cases, is to extend trust to chains of people she will never meet—observers, technicians, editors—whose reliability she infers from the institutions that bind them. Nearly every belief she holds is, in this sense, borrowed.

> Merely returning the lake to the conditions that preceded its collapse, therefore, will not return it to its former state.

It is natural to assume that a damaged ecosystem can be restored simply by reversing the pressure that damaged it. (①) A shallow lake that has turned murky from fertilizer runoff, for instance, should regain its clarity once the runoff is cut back to its former level. (②) Yet such lakes often stay murky long after nutrient inputs have fallen below the level at which the collapse first occurred, because the murky state sustains itself through a feedback of its own. (③) Algae that thrive in turbid water shade out the rooted plants that once anchored the sediment, and without those plants, every breeze stirs nutrients back into the water. (④) Managers must instead drive nutrient levels far below the original threshold, or break the loop directly—by removing the bottom-feeding fish that uproot young vegetation, for example. (⑤) The path back, in other words, is not simply the path out, retraced.

> Suppose a forgery is so flawless that no expert, armed with any instrument, can tell it from the original. It then seems arbitrary to prize one canvas above the other; after all, what we see is the same.

(A) But this argument quietly assumes that what we see is fixed by the object alone. In fact, our perception of a painting is shaped by what we know of the circumstances of its making—the problems the painter confronted, the conventions she was defying.

(B) On this view, the forgery is not a lesser copy of the same achievement but a different act altogether, one that solves no problem except that of deceiving its audience. Its visual identity with the original conceals a radical difference in what it accomplishes.

(C) A brushstroke that was audacious in 1650 is mere imitation in 1930, even if the two strokes are physically indistinguishable. What the original presents, then, is not merely a surface but an achievement—and an achievement cannot be duplicated by reproducing its result.

> That inference, however, collapses under a single change in what the players are shown.

Experts in many fields display what looks like a prodigious memory. (①) A chess master who glances at a mid-game board for five seconds can reconstruct the positions of nearly every piece, while a novice recalls only a handful. (②) It is tempting to infer that expertise rests on a general enlargement of memory capacity, as if years of practice had simply widened the mind's storage. (③) When the same number of pieces is scattered at random, in arrangements that could never arise in actual play, the master's advantage all but vanishes. (④) What the master stores, then, is not two dozen separate pieces but a few meaningful configurations, each retrieved as a single unit from a vast archive of games already seen. (⑤) Expertise, on this account, does not enlarge the container; it enlarges what can be packed into each of its compartments.

> Every legal system must repeatedly choose between rules and standards. A rule fixes in advance exactly what conduct is allowed—"no driving above 100 kilometers per hour"—whereas a standard defers the judgment to a later moment, to be made in context—"no driving at an unreasonable speed."

(A) Neither form, then, is simply superior to the other. The choice between them is better understood as a decision about when, and by whom, the costs of judgment are to be paid: once and in advance by the lawmaker, or repeatedly and after the fact by the courts.

(B) The standard reverses this trade. It can be fitted to the particulars of each case, but only by surrendering the very certainty the rule provides, for no driver can know beforehand how a court will later construe "unreasonable."

(C) The rule's great virtue is predictability: drivers know precisely where the line lies, and officials can apply it without lengthy deliberation. Its vice is that it will inevitably misfire at the margins, penalizing a careful driver on an empty highway while excusing a reckless one who stays just under the limit in a blizzard.

> The locomotive changed this by compressing into hours what had once been a journey of days.

Before the railways, every town kept its own time, set by the position of the sun overhead. (①) Noon in a western town arrived several minutes later than noon in an eastern one, and no one found this troubling, since few people traveled fast enough for the difference to matter. (②) A traveler crossing the country in a single day now passed through dozens of local times, and a timetable that listed departures in each station's own hour became nearly impossible to read, let alone to coordinate. (③) The solution—dividing the land into broad zones, each keeping a single uniform time—was at first resisted as an affront to nature, since it severed the clock from the sun. (④) Yet within a generation, the new time had become so familiar that local solar time came to seem the artificial one. (⑤) What began as a convenience for scheduling trains ended by redefining what people meant by "the time."

> It is often said that a single contradictory observation is enough to bring down a scientific theory. The actual history of science tells a more complicated story.

(A) Such patience is not mere stubbornness. A theory that has succeeded across thousands of predictions has earned a presumption that, when an observation fails to fit, the fault lies elsewhere—in the instruments, in some unseen body, in an error of calculation—rather than in the theory itself.

(B) Nor is this presumption unconditional. An anomaly becomes decisive only when a rival theory appears that can absorb it along with everything the old theory already explained; until then, scientists face a choice not between a flawed theory and a correct one, but between a flawed theory and no theory at all.

(C) For decades, astronomers knew that the orbit of one planet shifted in a way their most trusted theory could not account for, yet almost no one proposed abandoning that theory. The discrepancy was simply set aside as a puzzle, presumably to be resolved by some factor not yet identified.

> Where such arrangements did collapse, it was often because an outside power had dismantled them in favor of one of the very remedies that theory prescribed.

For much of the twentieth century, the prevailing view held that any resource used in common—a pasture, a fishery, a forest—was doomed to ruin. (①) Each user, reasoning that the gain from taking a little more accrued to himself while the cost was spread across everyone, would overexploit the resource until nothing remained. (②) The only remedies, it seemed, were to carve the resource into private holdings or to hand it over to a central authority. (③) Field research, however, documented hundreds of communities that had sustained shared resources for centuries without resorting to either remedy. (④) Their success rested on arrangements the users had devised for themselves: clear boundaries on who could participate, monitoring carried out by the users themselves, and sanctions that escalated with repeated violations. (⑤) The tragedy of the commons, it turned out, was less a law of nature than a description of what happens when users are stripped of the capacity to govern themselves.
